ABSTRACTED-PUB-NO: TP 79010A

BASIC-ABSTRACT:

Communication systems which utilise parallel data transmission lines are distance-limited because the skew between the lines becomes excessive and the receiver cannot reliably use be one clock to latch the data on all the lines.

A compensation scheme is proposed which utilises a scrambling circuit (a pseudo-number generator) to scramble the N input data streams before transmission. A clock and control signal, Manchester encodes, is simultaneously transmitted with the N scrambled data streams. The receiver utilises a descrambler including an identical pseudo-number generator. A Manchester code violation signals the receiver to turn on the descrambler. Clock recovery techniques are used to align the descrambled data. @(-pp)
